2

# Control of (Flexible) Structures

- Usually, models for (flexible) structures can be obtained in two ways:

- Lagrangian Approach for distributed Parameters Systems

$$\frac{\partial}{\partial t} \left( EI \frac{\partial^2 y}{\partial x^2} \right) + \rho \frac{\partial^2 y}{\partial t^2} = p$$

- In this case, the system has to be discretized (FEM)

- Lumped Parameter Systems

3

# Placement of Sensors and Actuators

- Where to place sensors and actuators ?
  - Infinite possibilities (depends on your discretization)
- Two Options:
  - Collocated Control  $\Rightarrow$  sensor and actuator are placed in the same position (control what we measure)
  - Non-collocated Control  $\Rightarrow$  sensor and actuator are placed in different positions

3/5/2004

ASE170p - Controls Lab

4

## Examples

- Rectilinear Plant: Suppose we would like to control position of mass 3:

Control  $x_3(t)$

Actuator in  $x_1$

Can measure  $x_1, x_2$  and/or  $x_3$

3/5/2004

ASE170p - Controls Lab

5

## Examples – cont.

- Take the following simplified Model

- Wants to control position of  $m_2$  using actuator at  $m_1$  and sensors either at  $x_1$  or  $x_2$ .

3/5/2004

ASE170p - Controls Lab

6

## Examples – cont.

- Implement a PD, let's say, based on the damped control of the previous lab using  $x_1$  as feedback  $\Rightarrow$  Collocated Control

$$G_c(s) = K_p + K_d s$$

First Trial

Improved resp. for  $x_1$

3/5/2004

ASE170p - Controls Lab

7

## Solutions

- For systems with high-frequency vibration modes, i.e. plant exhibits pair of complex conjugate poles near the imaginary axis  $\Rightarrow$  Use of a Notch Filter (or pole-zero cancellation filter)

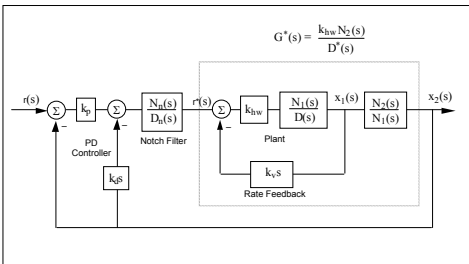

- For the coupling problem  $\Rightarrow$  use minor loop feedback (example: rate feedback)

3/5/2004

ASE170p - Controls Lab

8

## Solutions – cont.

3/5/2004

ASE170p - Controls Lab

9

## Notch-Filter

- Cancel poles that are close to the imag. axis by placing a zero at the same position. Example:

– Plant  $\Rightarrow G_p(s) = \frac{1}{(s^2 + 0.8s + 4)}$

Notch-Filter

$$G_f(s) = \frac{(s^2 + 0.8s + 4)}{(s + 0.384)(s + 10.42)}$$

3/5/2004

10

## Rate feedback

- So far, we have used series controller in the forward path (PID, Lead,-Lag, etc...)
- Advantages in placing the controller in a minor feedback loop  $\Rightarrow$  used for positional servo systems (tachometer);
- Behaves as a PD controller;

3/5/2004

ASE170p - Controls Lab

11

## Today's Experiment

- Use the following configuration

- Start with the PD controller designed for a 1DOF and iteratively determine the best PD controller for both masses using a collocated-type controller
- You can use Matlab simultaneously with the implementation for best results.
- Use LabVIEW Software
- Values of the PD are given on the Hand-out!!

12

## Today's Experiment – cont.

- For your lab report, you will also design a noncollocated PD controller + Notch Filter, using the LabVIEW parameters
- Follow all steps on the lab manual, but disregard implementation.
- **Optional ⇒ Implementation of your PD noncollocated design**
  - If you want to implement it, let me know, so you can come back later
  - You will have to recalculate your PD ⇒ implementation of the noncollocated ⇒ use ECP.
